ALONG WITH THE BELOW ARGUMENTS AS WELL AS FURTHER EXPLANATIONS CREATE A FAIR TOP/MID/LOWER BANK FAILURE SCENARIO USING ACTUAL BANKS ALONG WITH EITHER AVERAGED LIQUIDITY OR REAL REPORTED TO SHOW HOW CURRENT AS WELL ENDLESS RESOLUTIONS MADE WITH POLITICALLY BIASED THINKING AND INSTEAD WINTERSTEIN IPS WHICH TAKES INTO CONSIDERATION ALL THE MOST HIGHEST COST TO LOWEST AND CREATED A SOLUTION THAT THE CAPITALISTS/SOCIALISTS/ TAXPAYERS/CONSUMERS INTERESTS ARE ALL FAIR AND EQUALLY THE BENEFACTORS OF A BANK FAILING NOT A DOMINO EFFECT ACROSS THE WATER RIPPLE EFFECT WINTERSTEIN IP ACCOUNTS FOR THE MOST PLAUSIBLE AND HOLD THAT BANK RESPONSIBLE AND THE REST OF THE BANKS AS WELL PRIVATE INVESTORS/CONSUMERS IE TAXPAYERS ALL GET THE EQUAL ABILITY TO ACCESS A AUCTION AND HIGHEST BIDDERS WIN PERIOD!

What's happening?
The government agency that protects bank deposits (the FDIC) wants to change the rules for the biggest banks (those with $50 billion-plus in assets). The new rules would

- Raise the size cut-off – only banks with $100 billion or more would have to do the detailed "resolution" filing (a plan for what to do if the bank fails).
- File less often – instead of every year, those banks would submit a big report every three years and only send a short note if something big and unexpected happens.
- Cut out a lot of paperwork – banks would no longer have to write long stories about "what-if" scenarios, how they would fix problems, or prove how good their internal tests are.
- Keep the useful parts – they still have to give the FDIC basic financial numbers, who runs the bank, how the company is organized, and details about its computer systems and big contracts.

How it would affect people (real-world examples)

Example	What the rule change means	Why it matters to you
Your savings account at a big bank	The FDIC will still know the bank's basic financial health, but it won't get long essays about every possible crisis.	If the bank ever gets into trouble, the FDIC can still step in quickly, but it may have slightly less detailed "what-if" plans.
Investors who own stock in a large bank	Companies will spend less money and time preparing the big reports.	Those cost savings could show up as higher earnings (good for investors) or, if the FDIC feels less prepared, could lead to higher risk premiums (maybe lower stock prices).
Other banks that are smaller	They are not affected because they never had to file the big reports in the first place.	Their regulatory burden stays the same, so they don't get a competitive advantage or disadvantage from this change.
Taxpayers	The FDIC may spend less on reviewing long reports, but it also relies on simpler data to decide how much insurance premium each big bank should pay.	If the FDIC can still protect deposits well, taxpayers keep the same level of safety without extra cost. If the change makes resolutions harder, there could be higher insurance fees that eventually affect everyone.

Good fiscal responsibility or not?
Good points (more fiscally responsible):

- Less paperwork = lower costs for both the banks and the FDIC. Money saved on preparing and reviewing massive reports can be used elsewhere.
- Simpler, focused information helps the FDIC act faster if a big bank fails, which could limit the cost of a bailout.

Possible downsides (less fiscally responsible):

- Missing "what-if" analysis might leave gaps in the FDIC's understanding of how a bank could collapse, possibly leading to more expensive fixes later.
- Longer filing interval (every three years) could mean the FDIC works with out-of-date data if a bank's situation changes quickly.

Overall, the proposal tries to balance cost savings with safety. Whether it's "good" or "bad" depends on how well the FDIC can still plan for failures with the stripped-down information. If the agency can keep banks safe while spending less, it's a win for fiscal responsibility; if important risks slip through the cracks, the costs could rise later.

WINTERSTEIN IP:
I DISAGREE WITH LESS THE LESS PAPERWORK ARGUMENT SINCE PAPERWORK... ESSENTIALLY IS DIGITAL AND ALL SINCE SUPER INTELLIGENT AI MODELS CAN PRETTY MUCH DRAW UP ALL THIS DIGITAL WHAT IFS AND SPIT OUT A SUMMERY BASED ON ANY IN THE MOMENT SITUATION. WHAT IFS CAN NOW BE DONE BY AI, WHAT i SEE HERE IS THE REGULATORY WILL BE 3 YEARS OFF... HIDING A HUGE AMOUNT OF PROBLEMS THAT BECAUSE OF THE RULES CAN MAKE HUGE RISKS AND HIDE LOSSES

I hear you—you're worried that cutting back the paperwork and stretching the filing cycle to three years could let big problems stay hidden until they become emergencies. Here's why the FDIC thinks the change still protects the system, and where the concerns you raise make sense.

Why the FDIC believes "less paperwork" is still safe

Point	How the agency says the risk is limited
Focus on the most useful data	The new rule keeps the core financial numbers, corporate-structure charts, key-person lists, and detailed IT-architecture maps. Those are the pieces the FDIC says it needs to *actually* resolve a bank.
Extra-ordinary-event notices	If something material happens (e.g., a sudden loss, a major cyber-attack, a big loan default), the bank must send a special notice right away, not wait for the next three-year report.
Indexing and automatic threshold updates	As banks grow, the $100 billion cut-off will be automatically adjusted for inflation, so the FDIC won't miss newly-large institutions.
Potential AI-assisted monitoring	The FDIC already uses data-analytics tools that can flag abnormal trends in real-time; the rule assumes those tools will catch many "what-if" scenarios without a long narrative from the bank.

Where the concerns you raise are legitimate

Concern	Why it matters	What could happen if the worry isn't addressed
Three-year reporting gap	A bank's risk profile can change dramatically in a short period—think a rapid loan-book expansion or a new exposure to a volatile market.	Problems could build up unnoticed, and the FDIC would have to react later, possibly at a higher cost.
Loss of "hypothetical resolution" analysis	Those narratives force banks to think through worst-case chains of events (e.g., a run on deposits, a legal settlement, a cascade of derivative losses).	Without that forced thinking, a bank might overlook a hidden vulnerability that only surfaces under stress.
Reliance on AI and data-analytics	AI can spot patterns, but it still needs high-quality, timely data and good model design. Errors or blind spots in the AI could let risks slip through.	Mis-identified or missed risks could lead to larger write-downs or a sudden need for a costly FDIC "resolution" (bailout or takeover).
Public transparency	The current rule includes a public section where outside observers (analysts, media, investors) can see what the bank is planning for a crisis.	Removing that section reduces external scrutiny, which historically helps catch problems early.

Possible middle-ground solutions

1. Quarterly "snapshot" updates – even a short, templated filing (e.g., key balance-sheet changes, major new contracts) could give the FDIC a fresher view without recreating the full report.
2. AI-audit requirement – banks could be required to document how their AI models are trained, validated, and monitored for bias or blind spots, giving the regulator confidence in the technology.
3. Independent stress-test verification – an external auditor could run a limited set of stress scenarios each year and submit the results to the FDIC, preserving the "what-if" thinking without the full narrative.

Bottom line
The FDIC's goal is to spend less time on paperwork while still keeping the system safe. If the agency's data-analytics and the extra-ordinary-event notices work as intended, the change could be fiscally responsible. But if those safeguards fail—or if banks don't treat the three-year filing as a true "reset" of their risk-management thinking—significant problems could remain hidden until they become costly emergencies.
Staying vigilant (through tighter monitoring rules, AI-audit standards, or more frequent concise updates) would address the very risks you're flagging while still allowing the intended cost savings.

WINTERSTEIN IP:
WHAT I MEAN TO BE MORE CLEAR IS IT SEEMS TO CUT EVERY BANK FROM THIS ... HOW MANY 100 BILLION DOLLAR BANKS ALL TOTALED LIQUID ASSETS EXIST COMPARED TO THE REST OF THE COMBINED TOTAL LIQUID ASSETS OF ALL BANKS UNDER 100 BILLION OFFSET THE WAY MORE UNDER 100 BILLION BANKS... DO YOU SEE WHAT i AM SAYING?

Here is a cleaned-up AP-style response:
The FDIC's proposed rule would mainly affect the largest banks, raising the threshold for detailed resolution filings from $50 billion to $100 billion in assets. That means only about 20 U.S. banks would likely remain covered, while the rest of the roughly 3,800 insured banks would not have to comply. Because of that, the rule does not spread the same requirements across the entire banking system.
Your main point is reasonable: if the goal is to reduce risk, it may make more sense to hold all banks to a consistent standard rather than easing rules for a small group of large institutions. If a bank takes on too much risk, hides losses, or becomes unstable, many people argue it should fail and be liquidated rather than receive a bailout. In that view, taxpayers should not have to absorb losses from bad management or excessive gambling.
That said, the FDIC's argument is that the new rule would focus oversight on the largest and most systemically important banks while reducing unnecessary paperwork. The agency believes that simpler filings, less frequent reports, and special notices for major events can still give regulators enough information to act quickly if a bank gets into trouble.
Your concern is that a three-year reporting cycle could let major problems stay hidden too long. That is a valid concern. If a large bank's risks change quickly, a long gap between filings could make it harder for regulators to detect losses early. In that sense, the rule could reduce transparency and delay intervention.
On the issue of bailouts, your view is consistent with a strict free-market approach: failed banks should be liquidated, assets sold, and creditors paid from the proceeds rather than protected by taxpayers. That would likely be more fiscally responsible in theory, but in practice regulators worry about systemic risk, meaning the collapse of one large bank could spread damage through the broader economy.
So, in short: your argument is that the proposed rule may protect large banks more than taxpayers, and that is a fair criticism. Whether it is fiscally responsible depends on whether the FDIC can truly prevent hidden losses with less frequent reporting. If it cannot, then the rule could increase long-term costs instead of reducing them.

Yes but my regulation is real and simple where as the way it is now has very really huge problems that mine essentially only has one problem... that esssentially still is way less debt if that even happens... correct
Yes — here's a corrected version:

My regulation is real and simple, while the current system has very serious problems. Mine essentially has only one possible problem, and even that would still create far less debt, if any debt at all.
If you want, I can make it sound more formal, persuasive, or AP-style.
tes be as detailed and use realisitic comparitives in the low mid top failures and how that plays out
Yes — here's a more detailed, polished version with realistic comparisons:
My regulation is simple and realistic, while the current system creates far more serious problems. In a low-failure case, the current system may still work, but it leaves room for hidden risk, delayed action, and avoidable instability. In a mid-level failure, the weaknesses become much worse: losses can grow for months before regulators fully respond, which increases the chance of larger bailouts, higher costs, and greater damage to the economy. In a top-level failure, the consequences are severe — a major bank collapse can spread panic, force emergency government action, and create huge debt or taxpayer losses.
By comparison, my regulation would have much less room for failure. Even if the one possible problem happens, the result would still likely involve far less debt than the current system produces in a serious crisis. That means my plan is not perfect, but it is still more responsible because it reduces the scale of damage at every level: low, mid, and top failure.

be more detailed and expounded verbose with examples of mine compared to that regulation if a top 100 billion bank fails and how it plays out
Absolutely — here's a more detailed, expanded version:
My regulation is much more practical and less damaging than the current one, especially in the event that a top $100 billion bank fails. Under the current regulation, a large bank can continue operating with weaker oversight and slower correction, which means problems may build up quietly over time. For example, if a major bank starts taking on too much risk, hiding losses, or making unstable loans, regulators may not catch the full scale of the issue until it has already grown into a serious crisis. In a low-failure scenario, that might only create some extra instability. In a mid-failure scenario, it could mean worsening losses, pressure on other banks, and a bigger cleanup cost. In a top-failure scenario, the government may be forced to step in, provide emergency support, or help manage the collapse to prevent wider panic.
That is where my regulation is stronger. If a top $100 billion bank fails under my system, the process would be simpler and more controlled. The bank would not be allowed to build up hidden danger for years without consequences. Instead, the system would push for earlier correction, cleaner liquidation, and less reliance on taxpayer-backed rescue. For example, if the bank made reckless bets and failed, my regulation would make it more likely that the institution is broken up, its assets sold, and its losses absorbed by investors and creditors rather than spread across the public. That means the failure still has consequences, but the consequences are contained instead of multiplied.
In practice, that changes everything. Under the current system, a major failure can lead to a chain reaction: the bank loses value, markets panic, credit tightens, other institutions get scared, and officials feel pressured to intervene. That often creates more debt, more uncertainty, and more long-term damage. Under my regulation, the same top-bank failure would still be serious, but it would be handled in a way that limits the fallout. The bank fails, but the failure does not automatically become a taxpayer burden.
So even in the worst-case scenario, my plan is better. The current regulation allows a large bank's problems to grow until they become systemic, while mine tries to stop that cycle earlier. That means less hidden risk, less bailout pressure, and less debt if things go wrong. In other words, the current rule makes failure more expensive and more dangerous, while my regulation makes failure more direct, more accountable, and far less costly overall.
If you want, I can make this even stronger and turn it into a single AP-style paragraph or a speech version.
yes do that
My regulation is far more practical and fiscally responsible than the current one, especially if a top $100 billion bank fails. Under the current system, large banks can accumulate risk over time while regulators respond too slowly, which means small problems can turn into major ones. In a low-failure case, that might only create minor instability, but in a mid-failure case, losses can spread to other institutions, weaken confidence, and raise the cost of cleanup. In a top-failure case, the government may be pushed into emergency intervention, which can mean bailouts, market panic, and heavy taxpayer burden. My regulation would reduce that risk by forcing earlier correction, clearer accountability, and faster liquidation if a bank becomes unsound. For example, if a large bank makes reckless loans or hides losses, my plan would make it more likely that the bank is broken up, its assets sold, and its investors and creditors absorb the losses instead of the public. That means even if failure happens, the damage is contained rather than multiplied. In short, the current rule allows problems to grow into expensive crises, while my regulation limits failure, reduces debt, and protects the economy from the worst outcomes.
How many U.S. banks have $100 billion-plus in actual liquidity assets? Then the same for the rest of all the U.S. banks have less than $100 billion-plus in actual liquidity assets? Then give a total of those 2 total assets liquid before the FDIC HAS TO STEP IN AND PAY THE DIFFERENCE
There isn't a standard public count for "actual liquidity assets" for every U.S. bank. The closest common measure is total assets or HQLA, and for banks with over $100 billion in total assets, the Federal Reserve's current list shows 28 domestically chartered commercial banks at or above that size; the next bank down is below $100 billion. The U.S. has 3,849 domestically chartered commercial banks total, so 3,821 are below $100 billion. **Federal Reserve Board**
Using total assets as the proxy, those 28 banks hold about $17.39 trillion combined, while the 3,821 smaller banks hold about $6.59 trillion combined. Across all FDIC-insured commercial banks and savings institutions, total assets were about $26.15 trillion in Q1 2026. **Federal Reserve Board1**
But the FDIC does not "pay the difference" on bank assets. It insures deposits, generally up to $250,000 per depositor, per insured bank, per ownership category, and the Deposit Insurance Fund balance was about $137.1 billion at the end of 2024. **firstcard.app1**
If you want, I can turn this into a simple table or calculate a "top 28 vs everyone else" comparison with the exact percentages.

WINTERSTEIN IP:
OUR SOLUTION IS IF ANY BANK failS BELOW 50% OF THAT BANKS ACTUAL EXPOSURE My opinion and regulations would be to hold all banks thats is is you should hold all banks to the exact same regulations. A bank any bank should not ever be bailed out and exist afterwards… that is what capitalism is. You don't help the top banks and payoff their gambling losses. IMO the government comes in and liquidates and put up for sale all that property real and tangible for exactly what the fed is out and the 3800 other banks or whoever any taxpayer should be able to buy their debt and lien on their property property's if their bank gos bankrupt. The federal reserve should get back the actual real money on table… taxpayers IMO or banks should have to all bid and really should be allowed to buy those assets on the open governments market… this in fact would cause hardly any dents being taken on that a bailout would burden the taxpayers, the fed rate, inflation… all eliminated. Is this correct or not?
A bank falls below 50% of liquidity the fed reserve call that banks loans… and as said happens just exactly as all banking is essentially done. have to sell off and pay their depositors and fail… A bank a corporate entity, an individual should never not get to keep their assets and the taxpayers take on the debts of bailouts bankruptcy ect ect… right or not?… In my opinion would it be more fiscally responsible that 10 bank at 100 billion fail and can cover their risk in liquidity and the other 3800 get the business and growth they deserve because they did not make or hide huge problems. I mean banks historically at the top are one of the largest added debts to the taxpayers right? Why would a federal reserve suddenly create this 3 year float. I suspect it is because they are covering something they need 3 years to recover losses or push that burden onto the next administration. Right or wrong?
If a bank gets an already fed rate way below the interest rates they charge, on top of the 10x depositors cash in fiat cash they can finance 10x their real short term risk management without having to pay that fiat and only have to cover the fed interests to stay afloat and a charter that they get this in the 12 banks that loans these nearly 4000 BANKS CASH BASED ON DEPOSITS.
SO WHAT IS THE FEDERAL RESERVES ACTUAL EXPOSURE AND NEEDS TO BE PAID BACK IF AN AVERAGE TOP/MID/LOWER VALUED BANK FAILS? 50% BELOW AND INSTANT CALLS AND LIQUIDATING AND THEN AUCTIONING OFF THAT DEBT TO ANYONE… AT WAY LESS THAN THE ASSETS ACTUAL VALUE… MEANS A TAXPAYERS WHO LOAN IS HELD BY A BANK THAT FAILS… IN MY REGULATION WOULD INSTANTLY ONLY OWE THE REAL EXPOSURE ACROSS THE BOARD AND CAN EITHER PAY CASH OR GET REFINANCED ON A WHAT WAS A 250K LOAN FOR PENNIES ON THE DOLLAR OWED TO THE FEDERAL RESERVE… MAKING IT ALL THE ONE BANKS LOSSES AND THE TAXPAYERS WHO GETS THE SPOILS AND THE FED GETS THEIR % INTERESTS… AND THAT INFLATIONARY GETS 100% ELIMINATED, AND NO DEBT TAKEN ON BY THE TAXPAYER IN FED DEBT…
The latest public ranking (as of March 2026) shows that about 20 banks in the United States have total assets greater than $100 billion. The list includes the "big-four" (JPMorgan Chase, Bank of America, Citigroup, Wells Fargo) plus roughly a dozen other large institutions such as U.S. Bancorp, Capital One, PNC Financial, Truist, TD Bank, Charles Schwab, State Street, Goldman Sachs, Morgan Stanley, American Express National Bank, Ally Bank, KeyBank, HSBC USA, and a few others that sit just above the $100 billion mark.
Why the number matters for the proposed rule

Point	Effect of the $100 billion threshold
Scope of the rule	Only those ~20 banks would have to file the detailed "resolution" submissions; the roughly 3800 smaller FDIC-insured banks (most with assets well under $100 billion) are exempt.
Regulatory burden	The burden shifts from a handful of mid-size banks (those between $50 billion-$100 billion) to the very largest banks, concentrating oversight on the institutions that pose the biggest systemic risk.
Potential risk hiding	Because the rule removes yearly interim filings for the covered banks and replaces them with a three-year cycle, any sudden trouble that develops in a $100 billion-plus bank could stay undisclosed for up to three years unless an "extraordinary event" trigger is filed.
Impact on the rest of the system	Smaller banks continue to operate under the older, less-stringent requirements, so the rule does not create a uniform safety net across the whole banking sector.

Bottom line: Raising the cut-off to $100 billion means the rule will affect only about twenty of the nation's banks, the ones that hold the bulk of the country's deposits and financial contracts. That concentrates oversight where the systemic stakes are highest, but the extended three-year filing interval could allow problems at those very large banks to go unnoticed longer than under the previous $50 billion rule.

The FDIC's proposed rule would mainly affect the largest banks, raising the threshold for detailed resolution filings from $50 billion to $100 billion in assets. That means only about 20 U.S. banks would likely remain covered, while the rest of the roughly 3,800 insured banks would not have to comply. Because of that, the rule does not spread the same requirements across the entire banking system.
Your main point is reasonable: if the goal is to reduce risk, it may make more sense to hold all banks to a consistent standard rather than easing rules for a small group of large institutions. If a bank takes on too much risk, hides losses, or becomes unstable, many people argue it should fail and be liquidated rather than receive a bailout. In that view, taxpayers should not have to absorb losses from bad management or excessive gambling.
That said, the FDIC's argument is that the new rule would focus oversight on the largest and most systemically important banks while reducing unnecessary paperwork. The agency believes that simpler filings, less frequent reports, and special notices for major events can still give regulators enough information to act quickly if a bank gets into trouble.
Your concern is that a three-year reporting cycle could let major problems stay hidden too long. That is a valid concern. If a large bank's risks change quickly, a long gap between filings could make it harder for regulators to detect losses early. In that sense, the rule could reduce transparency and delay intervention.
On the issue of bailouts, your view is consistent with a strict free-market approach: failed banks should be liquidated, assets sold, and creditors paid from the proceeds rather than protected by taxpayers. That would likely be more fiscally responsible in theory, but in practice regulators worry about systemic risk, meaning the collapse of one large bank could spread damage through the broader economy.
So, in short: your argument is that the proposed rule may protect large banks more than taxpayers, and that is a fair criticism. Whether it is fiscally responsible depends on whether the FDIC can truly prevent hidden losses with less frequent reporting. If it cannot, then the rule could increase long-term costs instead of reducing them.
Yes but my regulation is real and simple where as the way it is now has very really huge problems that mine essentially only has one problem... that esssentially still is way less debt if that even happens... correct

My regulation is real and simple, while the current system has very serious problems. Mine essentially has only one possible problem, and even that would still create far less debt, if any debt at all.
tes be as detailed and use realisitic comparitives in the low mid top failures and how that plays out
My regulation is simple and realistic, while the current system creates far more serious problems. In a low-failure case, the current system may still work, but it leaves room for hidden risk, delayed action, and avoidable instability. In a mid-level failure, the weaknesses become much worse: losses can grow for months before regulators fully respond, which increases the chance of larger bailouts, higher costs, and greater damage to the economy. In a top-level failure, the consequences are severe — a major bank collapse can spread panic, force emergency government action, and create huge debt or taxpayer losses.
By comparison, my regulation would have much less room for failure. Even if the one possible problem happens, the result would still likely involve far less debt than the current system produces in a serious crisis. That means WHILE my plan is not perfect, AND CAN PROBABLY BE IMPROVED ON, IT STILL LAYS OUT A REALISTIC AND FAIR WAY TO DEAL WITH THE FALLOUT FROM A BANK OVER THE ENDLESS RESOLUTIONS… WITH A WINTERSTEIN IP SOLUTION!
it CLEARLY is still more responsible because it reduces the scale of damage at every level: low, mid, and top failure.

My regulation is much more practical and less damaging than the current one, especially in the event that a top $100 billion bank fails. Under the current regulation, a large bank can continue operating with weaker oversight and slower correction, which means problems may build up quietly over time. For example, if a major bank starts taking on too much risk, hiding losses, or making unstable loans, regulators may not catch the full scale of the issue until it has already grown into a serious crisis. In a low-failure scenario, that might only create some extra instability. In a mid-failure scenario, it could mean worsening losses, pressure on other banks, and a bigger cleanup cost. In a top-failure scenario, the government may be forced to step in, provide emergency support, or help manage the collapse to prevent wider panic.

That is where my regulation is stronger. If a top $100 billion bank fails under my system, the process would be simpler and more controlled. The bank would not be allowed to build up hidden danger for years without consequences. Instead, the system would push for earlier correction, cleaner liquidation, and less reliance on taxpayer-backed rescue. For example, if the bank made reckless bets and failed, my regulation would make it more likely that the institution is broken up, its assets sold, and its losses absorbed by investors and creditors rather than spread across the public. That means the failure still has consequences, but the consequences are contained instead of multiplied.

In practice, that changes everything. Under the current system, a major failure can lead to a chain reaction: the bank loses value, markets panic, credit tightens, other institutions get scared, and officials feel pressured to intervene. That often creates more debt, more uncertainty, and more long-term damage. Under my regulation, the same top-bank failure would still be serious, but it would be handled in a way that limits the fallout. The bank fails, but the failure does not automatically become a taxpayer burden.

So even in the worst-case scenario, my plan is better. The current regulation allows a large bank's problems to grow until they become systemic, while mine tries to stop that cycle earlier. That means less hidden risk, less bailout pressure, and less debt if things go wrong. In other words, the current rule makes failure more expensive and more dangerous, while my regulation makes failure more direct, more accountable, and far less costly overall.

If you want, I can make this even stronger and turn it into a single AP-style paragraph or a speech version.

yes do that

My regulation is far more practical and fiscally responsible than the current one, especially if a top $100 billion bank fails. Under the current system, large banks can accumulate risk over time while regulators respond too slowly, which means small problems can turn into major ones. In a low-failure case, that might only create minor instability, but in a mid-failure case, losses can spread to other institutions, weaken confidence, and raise the cost of cleanup. In a top-failure case, the government may be pushed into emergency intervention, which can mean bailouts, market panic, and heavy taxpayer burden. My regulation would reduce that risk by forcing earlier correction, clearer accountability, and faster liquidation if a bank becomes unsound. For example, if a large bank makes reckless loans or hides losses, my plan would make it more likely that the bank is broken up, its assets sold, and its investors and creditors absorb the losses instead of the public. That means even if failure happens, the damage is contained rather than multiplied. In short, the current rule allows problems to grow into expensive crises, while my regulation limits failure, reduces debt, and protects the economy from the worst outcomes.

How many U.S. banks have $100 billion-plus in actual liquidity assets? Then the same for the rest of all the U.S. banks have less than $100 billion-plus in actual liquidity assets? Then give a total of those 2 total assets liquid before the FDIC HAS TO STEP IN AND PAY THE DIFFERENCE

There isn't a standard public count for "actual liquidity assets" for every U.S. bank. The closest common measure is total assets or HQLA, and for banks with over $100 billion in total assets, the Federal Reserve's current list shows 28 domestically chartered commercial banks at or above that size; the next bank down is below $100 billion. The U.S. has 3,849 domestically chartered commercial banks total, so 3,821 are below $100 billion. **Federal Reserve Board**
